Hiring Team, VOIS (Vodafone Intelligent Solutions)

Re: AI Engineer – Software & Product Infrastructure

I'm writing to apply for the AI Engineer role on the Software & Product Infrastructure team. I'm currently an AI Engineering Intern at Arche Robotics, where I built a monitor agent that parses live robot log streams and uses LLM-based classification to surface anomalies to the engineering team in real time — direct experience with the production monitoring and support work this role covers.

My background centers on LLM applications, RAG, and agentic workflows in Python. In ComplAI, a multi-agent compliance pipeline, I used the OpenAI Agents SDK with Pydantic guardrails and full observability via Langfuse and OpenTelemetry — tracing every agent call the way your team's requirements around monitoring and lifecycle management describe. In RAG-AI-Agent I built a retrieval pipeline over ChromaDB with a bounded tool-calling agent loop, and in an SDR pipeline project I orchestrated multiple LLM providers (Groq, OpenRouter) behind a single agent architecture with input guardrails and structured Pydantic outputs — the kind of provider abstraction and reliability work this role calls out.

I've deployed models behind FastAPI, containerized work with Docker, and I'm comfortable moving between prototyping and testing an AI system end to end. My hands-on production cloud experience (AWS/GCP/Azure) and Kubernetes are still developing — I'm actively building in that direction — but the core of this role, designing, integrating, and monitoring LLM and agentic solutions in Python, overlaps closely with what I already do day to day.

I'd welcome the chance to bring that experience to VOIS and grow into the rest of the role's scope. Thank you for your time and consideration.

Sincerely,
Yousef Alsayed Abdelfattah
